

Testing - Bug # 1638

Status:	Resolved	Priority:	Should have
Author:	Malte Jansen	Category:	
Created:	2008-10-02	Assigned To:	Karsten Dambekalns
Updated:	2010-10-20	Due date:	
Subject:	Static is not suppose to work in the way it's used in F3_Testing_Model_TestRunner.php		
Description			
File: http://forge.typo3.org/repositories/entry/package-testing/trunk/Classes/Model/F3_Testing_Model_TestRunner.php			
The following variable is defined as static, so you cannot change the content afterwards in the constructor. Especially not with an other object. (See http://de.php.net/manual/en/language.oop5.static.php#85277)			
<pre>public static \$componentManager; public function __construct(F3::Testing::Model::TestCaseRepository \$testCaseRepository, F3::Testing::Model::TestListener \$testListener) { ... self::\$componentManager = \$FLOW3->getComponentManager(); self::\$componentManager->unregisterComponent('F3::FLOW3::Session::SessionInterface'); self::\$componentManager->registerComponent('F3::FLOW3::Session::SessionInterface', 'F3::FLOW3::Session::Transient'); ... }</pre>			
So the apache might cause crash on some plattform with the Testing. I have located the crashing on windows with php5.3alpha2 to this constructor. If it's not called, the Testing does not crash.

The comment you refer to above explains that one has to use self::\$var and not self::var - but the code uses self::\$componentManager. This is correct use. And static means you can use a variable without having an instance of it's parent class. It doesn't make it immutable.

I suspect alpha2 to be rather unstable, it crashed on my machine with a bus error doing **anything**, so...
