Could you provide some detail about your setup? Path names, symlinks, Apache configuration regarding document root, ...

#3 - 2011-04-27 15:57 - Regine Rosewich

Hi Karsten,

I simply forgot to delete this bug-report. In the meantime I found out that the mentioned error message is thrown whenever there is something wrong with an object or a class (forgotten semicolons, wrong written properties, methods or whatever). So principally it's o.k. that the FLOW3-Compile throws an error, but the error-message should be a little bit more meaningful to facilitate the searching for errors.

If a syntax error is encountered, this is what I see on the CLI: karsten@kmac:conference (master)\$./flow3_dev flow3:core:compile PHP Parse error: syntax error, unexpected T_STRING, expecting T_FUNCTION in FooBar.php on line 123 PHP Stack trace: ...

In the browser I get essentially the same output before the HTML.

There is no way we can catch fatal errors to be logged, so you need to watch the PHP error log for those.

#5 - 2011-06-21 01:15 - Johannes K

In the browser I get essentially the same output before the HTML.

This doesn't show up for me (even in Development Context), I suppose because for CLI calls the php.ini setting display_errors is off (on my vanilla ubuntu 11.04 machine). Without this output this problem is very hard to debug, also the Exception message is misleading (points to configuration problems while it is 95% of the time simply a syntax error).

The Exception message should contain a reference to the "./flow3_dev flow3:core:compile" command to guide debugging.
