Updated:	2011-05-04	Due date:	
PHP Version:			
Has patch:			
Complexity:			
Affected Flow version:			
Subject:	Must specify table name with unique constraints and indexes with Doctrine 2		
Description			
<p>If a unique-constraint or an additional index is needed for a table/object, the Doctrine 2 ORM has the possibility to do this with a special annotation in the head of the class as shown in the following example:</p>			
<pre>@table(uniqueConstraints={@UniqueConstraint(name="klasse_unique",columns={"klasse"})})</pre>			
<p>If the full table name is not given in the annotation, like in the example above, the Doctrine 2 ORM generates a table which has exactly the name of the class. This collides with the new table-naming schema which normally names table like <package>_<subfolder of Domain\Model folder - if existing>_<classname>.</p>			
<p>If you fully qualify the @table annotation like shown below it works fine.</p>			
<pre>@table(name="welupdm_stammdaten_klasse", uniqueConstraints={@UniqueConstraint(name="klasse_unique",columns={"klasse"})})</pre>			
<p>It should not be necessary to furnish the fully qualified table-name unless explicitly wanted or needed.</p>

[BUGFIX] Make table name in @Table annotation optional

When using the @Table Doctrine annotation to specify unique constraints or indexes one had to specify the table name, although maybe not needed.

Fixes: #26482
