Has patch:	
Complexity:	
Subject:	Provide safeguard for preventing multiple submits of a form

Description

We need a mechanism which prevents the user from accidentally submitting a form multiple times. This should be handled both on the client and on the server side.

On the client side a simple JavaScript will check if the form has been submitted and if so displays a message if the user tries to submit it a second time.

On the server side some hash which is unique to that rendered form should be checked to figure out if that particular form instance is already being processed.
