Has patch:			
Complexity:			
Affected Flow version:			
Subject:	Method visibility filter does not work		
Description			
<p>The method visibility filter is not doing anything (again). A wrong regexp match parses visibilities like "public " or "protected ". The check for valid visibilities inside the PointcutMethodNameFilter is useless, because it accepts the space behind the visibility.</p> <p>There is also no real unit test for the parseDesignatorMethod method inside the PointcutExpressionParser and the functional test for protected methods had a wrong visibility (public instead of protected!).</p>

[BUGFIX] Fix method visibility filter

This change mainly fixes the parsing of the method visibility and adds a unit test that tests the actual parsing. Also the functional test for advices on protected methods is fixed to really target a protected method. To enable the unit test to get filters from a composite and as a performance improvement, a nested composite will only be created if the operator is not "&&".
