Subject:	Make Rangelterator use array pointer functions		
Description	<p>Rangelterator should use PHP's native array pointer functions if possible, as this could be faster and would eliminate the need to have a continuous numerically indexed array containing the iterators elements. This again would allow to remove the array_values() call in the constructor, which could become a real memory-hog if used with a lot of data.</p>

Rangelterator now uses PHP's native array traversal functions. This should resolve a potential memory usage issue caused by a necessary array_values call in the Rangelterator constructor. Resolves #317.
