[BUGFIX] ACL file permissions do not work correctly

When setting file permissions the setting of ACL would succeed but the set permissions did not work as expected. This changes fixes that.

In addition it makes the calls in a chain so that the check for the return value of the chmod commands is more robust. The directories that are created are now always owned by the command line user.

ACL inheritance works like with classic unix permissions: inherited ACL entries are set like the setgid bit when a new entry is created. Thus for existing stuff ACL entries must be set with +ai. Plus there is a subtle difference between delete and delete\_child when inheritance is involved.
