Fixed in commit:f04e09f613219a5d526ef3d08dde1673f0f42702

Would be great if someone could confirm that the "`__row|__foreign|name`" syntax for the placeholder is really final - in this case I could move this to the Core review directly.

Seems like documentation is missing here as well.

Hmmm wait - Tobi's patch was fine and all features introduced are explained there. But I found that within the FAL branch the placeholders utilized another nesting level ("`__row|__foreign|name`") which wasn't available from his patchset but needed by the FAL fields. That's why I'm asking whether this should pushed to the Core (as additional RFC) or not?
