Subject:	How to receive the correct class name for an object?		
Description	<p>Currently there is no helper method to find the correct class name of a given object. The reflection service should provide such a method.</p> <p>For now I would say we only have to handle doctrine lazy loading proxies and return the parente class for them.</p> <p>Can someone imagine different situations where <code>get_class(\$object)</code> does not return the correct (expected) class name from a users perspective?</p>
