Has patch:	No		
Complexity:			
Subject:	Provide utility method to get unproxied class name		

Description

In some cases, get_class($object) returns the Doctrine proxy class; and not the actual, intended class name.

In Doctrine itself, there is a method Doctrine\Common\Util\ClassUtils...

```
1  /**
2   * Get the real class name of an object (even if its a proxy)
3   *
4   * @param object
5   * @return string
6   */
7   public static function getClass($object)
```

which basically does some str_replace; unfortunately it doesn't work with FLOW3 proxies due to a different naming scheme.

A possibility is to provide a method that

```
1if ($object instanceof \Doctrine\ORM\Proxy\Proxy) {
2   return get_parent_class($object);
3}
```

but that's probably not very clean.

So, a reliable method to achieve that should be provided by FLOW3.
