<b>Has patch:</b>	Yes		
<b>Subject:</b>	New widget progress bar		
<b>Description</b>			
<p>I developed a new widget which might be interesting to move it to the core. It's an universal progress bar calling a controller action by ajax to load progress.</p> <p>You can easily use it in your own fluid templates by just adding</p> <pre>&lt;f:widget.progressbar id="progressbar" action="ajax" message="1" messageText="This text is shown below the progress bar" arguments="{itemsToLoad: 10}" controller="yourController" package="yourPackage" subpackage="yourSubpackage" /&gt;</pre> <p>For explanation:</p> <ul style="list-style-type: none"><li>- id means the id of the div container the progress bar is insert into</li><li>- action is the action to be called from the ajax request</li><li>- message indicates if a message under the progress bar should be displayed</li><li>- messageText is the default text to show (under the progress bar)</li><li>- arguments is an array of arguments passed to the action request</li><li>- controller defines the controller the action belongs to, if not set the current one is used</li><li>- package and subpackage define the package the controller belongs to, if not set the current ones are used</li></ul> <p>The actions has to return an json string having to keys:</p> <ul style="list-style-type: none"><li>- value has to be an integer representing the status in percent (with the percent sign)</li><li>- messageText is the string added to the message container below the progress bar (if enabled)</li></ul> <p>If you have any questions just ask me :-)</p>
