Has patch:	No		
Subject:	It should be possible to set a different template on a Fluid TemplateView inside an action		
Description	<p>Right now it's not possible to decide inside an action which view template should be rendered. Especially if the action itself doesn't have a template file the canRender() method will always return FALSE. Inside the initializeAction or initializeView method it's too early / too late to set a different template file and path.</p> <p>The idea is to always return TRUE in the canRender method and return the NotFoundView in the call to render when no template source could be found.</p>
