[[!]]**[FEATURE]** Content Negotiation for Media Types

This improves the support for detecting the Media Type (that is, "format" in an ActionRequest context) based on the request's Accept header.

This implementation supports Quality Values and Media Ranges as specified in RFC 2616.

The way to define the supported formats of a controller has changed: Previously a class property `$supportedFormats` contained a list of filename extensions which would be supported. This property is not supported anymore. Instead, controllers may now specify a list of IANA Internet Media Types in a property `$supportedMediaTypes`.

The default setting for these supported media types in ActionController is "text/html". You'll need to adjust your controllers accordingly if you relied on the `$supportedFormats` feature.

Also note that the format in ActionRequest is now NULL by default. The ActionController makes sure to set the correct format, but if you created your own ActionRequest for a special purpose, you need to take care of setting

it yourself.
