Complexity:			
Subject:	Enforce validation before persisting model objects		
Description			
<p>If there are validation rules defined for a (domain model) object, they should be enforced before actually persisting the object. This includes the property validation rules as well as the (custom) validation rules for the whole object.</p> <p>Later we also need to think of optimizations in this regard, e.g. if a property is not dirty and the object was reconstituted, there's no need to validate it again.</p>

Revision ecf96126 - 2010-03-24 12:16 - Karsten Dambekalns

[+FEATURE] FLOW3 (Persistence): When persisting all new and dirty objects are validated now, resolves #3846. If validation fails, an exception is thrown.

- Target version set to 1.0 alpha 8

#6 - 2010-03-04 11:38 - Karsten Dambekalns

- Status changed from Accepted to Needs Feedback

When validating during persistence exceptions thrown cannot be handled any longer, even redirects won't be stopped anymore. Thus it seems better to do the validation when adding to a repository. Any other thoughts?
