[BUGFIX] Release scheduler from classname field

Currently the scheduler depends at many parts on its classname field in the tx_scheduler_task table. This is not necessary as the classname is already stored in the serialized task object. By releasing scheduler tasks from their classname field backwards compatibility is maintained by the class_alias mechanism.

Ah, since the array key is used as class name, the namespace change breaks b/w compatibility for registered tasks ... we need to think about this issue again.

#5 - 2012-08-26 21:39 - Philipp Gampe

As said on the change, we properly need some kind of upgrade wizard that converts the task objects (and the corresponding sys_registry entries).

I do not know if I have some time left next week to look into it, but I will definitely review any changes done here since I know the scheduler code to main part.
