Subject:	As a user I want to get instructions how to fix file permissions on the first run		
Description			
<p>When Phoenix is downloaded / cloned from git and run without running the setfilepermissions command, the first hit will fail in most cases because the Data/* directory and others can't be created. Instead of displaying a hint on how to proceed, the raw PHP error messages slips through (see screenshot).</p> <p>dod:</p> <ul style="list-style-type: none">- catch error messages resulting from insufficient file permissions on first run- display message which gives instructions on how to run the setfilepermissions command <p>Even better (if possible):</p> <ul style="list-style-type: none">- redirect to setup tool- provide instructions for setting file permissions- check (through AJAX) if that worked out and proceed automatically if file permissions are fine
