**Subject:** Probably false behavior in symlinked environment

### Description

Hi,

I just tried to setup TYPO3 Flow where the sources where symlinked somewhere else. I my setup looked like this:

- Flow\_Base\_Distribution\_Clone (installed with composer)
  
- DocumentRoot
- Flow\_src -> Flow\_Base\_Distribution\_Clone
- Build
- Configuration
- Data
- Packages
- Application
- MyPackage -> SYMLINK to somewhere else
- Framework -> Flow\_src/Packages/Framework
- Libraries -> Flow\_src/Packages/Libraries
- bin -> Flow\_src/bin
- Web -> Flow\_src/Web
- flow -> Flow\_src/flow

This basically works but it shows at least two weird behaviors

- The "Data" folder of Flow\_Base\_Distribution\_Clone is used instead of the local one. (Clearing this didn't solve the routing problem btw)
- I removed the Welcome package (package:delete) but it still had some default route somewhere that catched any request

Maybe this setup is weird but I think there might be valid use-cases for this. Someone might wanna look into this so Flow can throw a warning if unsupported symlinks are used. Moving anything to the document root solved all problems.

If you have any questions, kust let me know.

Greets,  
Thomas
