Subject:	getIdentifierByObject for POP	-Objects	
Description			
PersistenceMana	ger::getIdentifierByObject() currently of ger::convertObjectToIdentityArray() the st suggests to make it possible to ref	nrows an exception if the array co	ontains such object.
NOTE			
Here the original When trying to use #1302628242: The It sould be possibl scope. Here is a example I have a ShopingE	e a session scope object as argumen e given object is unknown to the Pers e to use Session Scope Obejcts (or o	t in f:link.action viewhelper i get t sistence Manager. objects stored inside them) as arg etItems stroed inside. Now i want	. , , ,
- Category set to Vie	m New to Needs Feedback		
Objects that are not	known to the Persistence Manager don't	have an identifier. so how should we	generate the link? Serializing the complete object is

not an option.

Instead, you should inject the basket to your controller and have a deleteltemAction or similar.

Or did I get you wrong?

Objects that are not known to the Persistence Manager don't have an identifier. so how should we generate the link? Serializing the complete object is not an option.

Yes, that's the problem. Why can't they have an identifier of some sort? They are persisted in the Session so there sould be an identifier?

Instead, you should inject the basket to your controller and have a deleteltemAction or similar.

Thats what i am trying to do. I have a deleteltemAction but i cannot send the item as an argument because it is persisted in the session and has therefore no identifier.

Or did I get you wrong?

Yes, that's the problem. Why can't they have an identifier of some sort? They are persisted in the Session so there sould be an identifier?

The scope "session" is a specialization of "singleton". It is meant for object instances to exist exactly once in the current session – like a shopping basket.

So there is no need to pass the object around, as well as there is no reason to pass around singletons - because you can always inject the object.

Instead, you should inject the basket to your controller and have a deleteltemAction or similar.

Thats what i am trying to do. I have a deleteltemAction but i cannot send the item as an argument because it is persisted in the session and has therefore no identifier.

Well, the item in your basket should have some relation to a persistent entity (e.g. product) don't they? Maybe <u>https://github.com/robertlemke/RoeBooks.Shop</u> helps you (even though it's a bit outdated in the meantime). Or how does an item in your basket look like?

The scope "session" is a specialization of "singleton". It is meant for object instances to exist exactly once in the current session – like a shopping basket.

So there is no need to pass the object around, as well as there is no reason to pass around singletons - because you can always inject the object.

You got a point there for session objects. But what about any other prototype object possibly stroed inside a session scope object or maybe even a

arbitrary prototype which i want to pass to the next controller. Would it not be great to just use any prototype object as argument? Or at least if it is already stored in a sessionscope object? Likle my BasketItem?

Instead, you should inject the basket to your controller and have a deleteltemAction or similar.

Thats what i am trying to do. I have a deleteItemAction but i cannot send the item as an argument because it is persisted in the session and has therefore no identifier.

Well, the item in your basket should have some relation to a persistent entity (e.g. product) don't they? Maybe <u>https://github.com/robertlemke/RoeBooks.Shop</u> helps you (even though it's a bit outdated in the meantime). Or how does an item in your basket look like?

In my case the BasketItem hat property quantity, product but also configuration of the product. So in my case it is possible to put more than one basketItem with the same product in the basket. The only solution for my problem at the moment is to generate my own unique id for each item and sumbit that which is not really flow-style.

#5 - 2012-12-21 11:15 - Bastian Waidelich

- Project changed from TYPO3.Fluid to TYPO3.Flow
- Category deleted (ViewHelpers)

#6 - 2012-12-21 11:30 - Bastian Waidelich

- Subject changed from Usage of Session Scope Objects as arguments in f:link.action should be possible to getIdentifierByObject for POP-Objects

- Category set to Persistence
- Assigned To deleted (Bastian Waidelich)
- Priority changed from Should have to -- undefined --

Hi,

I moved this issue to the Flow tracker in order to get some more feedback, but I doubt that we should include such functionality to the core.

In my case the BasketItem hat property quantity, product but also configuration of the product.

You could simply pass the item index like:

1<f:for each="{basket.items}" as="item" iteration="iteration">

2 <f:link.action action="removeltem" arguments="{itemIndex: iteration.index}">Remove {item.title}</f:link.action> 3</f:for>

Of course the index is ambiguous in this case – if you open the link twice it might remove two items from the basket. If that's an issue you can easily give the item it's own id (e.g. via \TYPO3\Flow\Utility\Algorithms::generateUUID()) and use it like:

1<f:for each="{basket.items}" as="item">

2 <f:link.action action="removeltem" arguments="{itemId: item.id}">Remove {item.title}</f:link.action> 3</f:for>
