PHP Version:			
Has patch:			
Complexity:			
Subject:	RequestDispatchingAspect should check if entry point can handle current request		

Description

For AJAX, REST and other requests the default behavior of intercepting the request and choosing e.g. the WebRedirect entry point is not desirable.

There should be a "canHandleRequest" method in the entry point to check if the current request can be handled. For example an AJAX request with X-Requested-With:XMLHttpRequest should not get a redirect but a proper status code and header that links to a login service.
