TYPO3.Flow - Feature # 46050

Status:	New	**Priority:**	Could have
Author:	Thiago Colares	**Category:**	Log
Created:	2013-03-05	**Assigned To:**	
Updated:	2013-03-05	**Due date:**	
PHP Version:	5.3		
Has patch:	No		
Complexity:			
Subject:	To decouple log file writing at Logger->logException		

Description

The TYPO3\Flow\Log\Logger->logException() method perform itself the file log writing. As in log(), it could be decoupled to facilitate any override to this writing.

For example, in log(), is easily possible to set the backend as follow:

File: /project_path/Configuration/Settings.yaml

```
    TYPO3:
      Flow:
       log:
         # Settings for Flow's default loggers
         # see more at Framework/TYPO3.Flow/Configuration/Settings
         systemLogger:
           backend: MyPackage\Log\Backend\MyFileBackend
```

So far, I guess the only way is to set up the Objects.yaml, am I right?
