Subject:	Provide security skeleton		

Description

I need to allow to delete a comment by the author, hence I'd like to provide a deleteAction and an appropriate Policy.yaml snippet which is present per default and can be activated by users.
 	
Question is: should the Policy secure the Repository or the action? Currently my Policy.yaml for it looks like this,
 	
    resources:
     methods:
      TYPO3_Comments_RepositoryDeleteComment:
'method(TYPO3\Comments\Domain\Repository\CommentRepository->remove(object.author === current.securityContext.party))'
 	
but maybe deleteAction should be secured rather than the Repository->remove() method. What do you think?

Yes, usually Policies cover Controller/action pairs.

Your implementation would be "safer" but it would for example prevent you from calling CommentRepository::remove() from a CLI command.

ok great thx for your feedback.

How would you implement the actual controller; a direct controller or also via (the) widget?
