Updated:	2013-04-28	**Due date:**	
Has patch:	No		
Subject:	FormViewHelper does not define the default request method		

Description

Currently, the default value for the FormViewHelper attribute *"method"* is **NULL**, resulting in the output form attribute value *"post"*. This could possibly lead to strange behaviour in the code when checking for the method attribute value (**NULL** will actually evaluate to **TRUE** for both checking if *method* !== 'get' and *method* !== 'post') and also contradicts the HTML specification for forms, which sets the **default method** to **"get"**:

see http://www.w3.org/TR/html401/interact/forms.html#h-17.3 and
http://www.whatwg.org/specs/web-apps/current-work/multipage/association-of-controls-and-forms.html#attr-fs-method

This is a concern especially since the **CSRF** change, which only appends the token on non-GET method and validating the output in the Viewhelpertest package.

I hence suggest setting the **default value** for the method attribute to **'get'** - **or** if a breaking change is to be avoided at least set it do **'post'**.
