[BUGFIX] Cannot load css_styled_content TS using INCLUDE_TYPOSCRIPT

When installing extensions they may register plugins in ext_localconf.php.

By doing so some default TypoScript is generated in

ExtensionUtility::configurePlugin() that is then added using

ExtensionManagementUtility::addTypoScript().

Parts of the generated TypoScript are stored in

\$TYPO3_CONF_VARS['FE']['contentRenderingTemplates']* and are loaded later

during TypoScript parsing after including the content rendering template.

These TS parts are used to resolve which classes and methods to call when

a plugin needs to be rendered on a page. You can find them in

tt_content.list.20.*

"content default" used to be the old content rendering template with uid 43, today we use `css_styled_content` instead. The part in the TypoScript processing chain to load these generated snippets - `TemplateService::includeStaticTypoScriptSources()` - is only executed when loading the content rendering templates using the "Include static (from extensions)" field in template records.

In return this means if you try to move as much TS to files as possible you will still have to include `css_styled_content` through the Template records in the backend. In other words when actually trying to include `css_styled_content` TS from a file, the generated snippets for `tt_content.list.20.*` will not be loaded and thus no plugin can be executed.

[BUGFIX] Cannot load `css_styled_content` TS using `INCLUDE_TYPOSCRIPT`

When installing extensions they may register plugins in `ext_localconf.php`.

By doing so some default TypoScript is generated in

`ExtensionUtility::configurePlugin()` that is then added using

`ExtensionManagementUtility::addTypoScript()`.

Parts of the generated TypoScript are stored in

`$TYPO3_CONF_VARS['FE']['contentRenderingTemplates']*` and are loaded later

during TypoScript parsing after including the content rendering template.

These TS parts are used to resolve which classes and methods to call when

a plugin needs to be rendered on a page. You can find them in

`tt_content.list.20.*`

"content default" used to be the old content rendering template with uid

43, today we use `css_styled_content` instead. The part in the TypoScript

processing chain to load these generated snippets -

`TemplateService::includeStaticTypoScriptSources()` - is only executed when

loading the content rendering templates using the "Include static (from

extensions)" field in template records.

In return this means if you try to move as much TS to files as possible

you will still have to include `css_styled_content` through the Template

records in the backend. In other words when actually trying to include

css_styled_content TS from a file, the generated snippets for tt_content.list.20.* will not be loaded and thus no plugin can be executed.
