

TYPO3.Flow - Bug # 49624

Status:	Resolved	Priority:	Must have
Author:	Adrian Föder	Category:	Validation
Created:	2013-07-03	Assigned To:	Bastian Waidelich
Updated:	2014-08-27	Due date:	
PHP Version:			
Has patch:	No		
Complexity:			
Affected Flow version: Flow 2.0.0			
Subject:	Domain Model validators are executed twice		
Description			
when having, for example, a			
<pre>/** * @param SampleDto \$sampleDto {fq class name abridged} */ public function sampleAction(SampleDto \$sampleDto);</pre>			
and an appropriate Validator for that model placed in Domain\Model\Validator\SampleDtoValidator (i.e. a <i>Domain Model Validator</i> in the sense of [‡]), the validation for it is fired twice on action invocation.			
The argument's validator stack looks like the following then:			
<pre>ConjunctionValidator: SampleDtoValidator ConjunctionValidator GenericObjectValidator SampleDtoValidator</pre>			
as you can see, the SampleDtoValidator is there twice, that's why it's executed twice.			
If, however, the Validator is not a Domain Model Validator, means, it's not placed in Domain\Model\Validator; and annotated manually like			
<pre>/** * @param SampleDto \$sampleDto {fq class name abridged} * @Flow\Validate("\$sampleDto", type="Acme\Foobar\Somewhere\SampleDtoValidator") */ public function sampleAction(SampleDto \$sampleDto);</pre>			
...it's validated correctly only once.			
The validator stack then looks like			
<pre>ConjunctionValidator: SampleDtoValidator</pre>			

ConjunctionValidator
GenericObjectValidator

as you can see, the "inner" conjunction validator only has a GenericObjectValidator now.

[BUGFIX] Add domain model validators only once

If a domain model validator is present and a controller action accepts this domain model as argument, the validator is added twice to the validation tree.

It is added in ValidatorResolver::buildMethodArgumentsValidatorConjunctions() and in ValidatorResolver::addCustomValidators() which is called from ValidatorResolver::getBaseValidatorConjunction()

Both methods are called when building the validation tree in ActionController::initializeActionMethodValidators()

Resolves: #49624

Releases: master, 2.1, 2.0

I think that is something different.

The issue in this case is, that `ValidatorResolver->buildMethodArgumentsValidatorConjunctions()` adds a domain model validator if present and `ValidatorResolver->buildBaseValidatorConjunction()` calls `ValidatorResolver->addCustomValidators()` which also adds a domain model validator if the class is found.

I suggest to remove the according code from `buildMethodArgumentsValidatorConjunctions`
