Subject:	Prevent page reload if content structure is different		
Description	<p>Currently when a page is loaded via AJAX and the content structure of the loaded page is different from the initialized page, the whole browser location is reloaded. This is because we lack a way to initialize different structures for VIE. It shouldn't matter if it's a page with one content collection or two and what they're called.</p>

[!!!][FEATURE] improve reloading of content without neos-reloadable-content

This change removes the neos-reloadable-content CSS class, which was used to determine the sections which shall be reloaded. Now, we reload everything between #t3-page-metainformation (which is rendered directly after the body tag by the Neos PageTemplate.html) and #neos-application, which is rendered at the very end of the body by the same template.

This greatly improves the reloading experience, taking also changes to menu states, breadcrumb, and complete layout modifications into account.

Applying new CSS classes on <html> and <body> is not yet supported, though (but that did not work before this change, either).

This change is breaking because <neos:contentElement> does not have a reloadable-attribute anymore. Just remove these classes from your usages of <neos:contentElement>.

Make sure to check the corresponding changes as well.
