Subject:	Support of wizards/branched forms		
Description			
<p>I wondered if there is a chance to support junctions within a <i>FormDefinition</i>. My idea was to decide whether to show or to hide a set of Page objects depending from e.g. checking a specific box. I tried to do this similar to the <i>ConditionalRequiredFormElement</i> of the <i>TYPO3.FormExample</i> Package, simply by doing something like</p> <pre> \$this->getRootForm()->removePage(\$pageToDisable);</pre> <p>That solution works for one page-switch - if I press on next/previous at the page that I successfully skipped, I get led to the disabled one directly - that's really confusing.</p> <p>Maybe there is already a way to implement it as I imagine (see the pdf as example). Maybe I have to split the form into different forms which are simply connected by finishers?</p>

Sorry, I don't have time to tackle this at the moment. But nice try ;)
