Subject:	Login functionality		
Description			
<p>Almost every time I start a small project and want to base it on Flow, I need authentication and login functionality to be able to render user-based content. So I thought of the following scenarios on how to improve this:</p> <ul style="list-style-type: none">- build a generic package that provides a login form, a user model and the controller to login/logout the user- just document the needed steps, copy-paste the needed code templates in case one needs it- add this to the Kickstarter-Package <p>At the moment I prefer the last of the ideas as it would just help to quickly set-up the needed stuff in a new package - which then can easily be extended or modified for the specific use-case of that application.</p> <p>Any veto on adding this to the Kickstarter? Any better ideas? Any inputs from the maintainer(s) on how to prepare that feature, stuff that shouldn't be forgotten?</p>

Hi Mario,

I like the idea of adding that to the Kickstarter as most users of Flow have that available already.

Greetings,

Christopher

Could you provide me with a working patch that adds the functionality? Would be very helpful to then "kickstarterify" your working code :-)

You mean a kickstarted package that is extended with authentication and login? Yes, I could do that.

Exactly, either a kickstarted package with added login/logout functionality - or just a patch from a project, where the patch adds the functionality. I think that's easier to prepare the stuff to be kickstarted, if there's working code already.
