<b>Subject:</b>	Problem with phpBinaryPathAndFilename		
<b>Description</b>			
<p>Hi,</p> <p>i had beta version installed and upgrade to 1.x failed so i decided to do fresh setup. Using composer all files were fetched and i decided to copy Settings.yaml file from previous installation (DB was emptied but the credentials stayed the same).</p> <p>The problems begin when i wanted to run installer. Environment check always returned that my phpBinaryPathAndFilename is invalid in Settings.yaml. I tried various combination for php (cgi, fast-cgi, fpm) but nothing helped.</p> <p>During small conversation on #typo3-neos radmiraal suggested to comment out line 133 in file Packages/Application/TYPO3.Setup/Classes/TYPO3/Setup/Core/RequestHandler.php but this also didn't help. Finally i have changed phpBinaryPathAndFilename to /usr/bin/php5 and inside Packages/Application/TYPO3.Setup/Classes/TYPO3/Setup/Core/RequestHandler.php set function checkAndSetPhpBinaryIfNeeded() to just return TRUE without any checks. This way i was able to finish setup process without any problems.</p> <p>I'm not sure where the problem was exactly and hope for some checks in this area.</p>
