Subject:	nested domain-models produce a endless loop		
Description			
<p>Hi,</p> <p>I have special nested domain-models. To reproduce the Bugs it is necessary to use no Lazy SplStorageObjects. I have two classes. Each class has a property to store the other class in a SplStorageObject.</p> <p>The class backend.php calls the method persistObject(\$object). The Objects in the SplStorageObject are stored in a QUEUE. All objects in the QUEUE are persisted again (persistObject(\$object)). It is a endless loop to persist the nested object.</p> <p>Error: Fatal Error: Maximum function nesting level of ...</p> <p>One solution would be to persist only objects that have not been saved so far.</p> <hr/> <p>The second problem occurs with an update. The method removeObject() removes the oldObject1 from the identity-mapper.</p> <p>persistObject(): updatedObject1 -> SPL -> Object2 (AOPProxy) -> SPL -> OldObject1 = cant find the UID and the OldObject1 in the Identity-Mapper</p> <p>Error: CRITICAL TYPO3 Uncaught Exception 1246892970</p>
