<b>Subject:</b>	Content cache is not domain specific		
<b>Description</b>	<p>The content caching does not take the currently active domain into account. This means that snippets are cached containing url's in the content which could point to different url's then the user is currently visiting.</p> <p>Imagine you've a setup with 2 domains pointing to 1 site node, domain1 and domain2. Whatever domain will be opened first will be in the cached snippets, and those will be served on every subsequent request no matter what domain the user is visiting.</p>

[BUGFIX] Content cache is not domain specific

The content cache does not take the visited domain into account. This leads to problems when multiple domains point to the same site node. The first domain used while accessing a node will be used for generating the cache entries, and will be served for subsequent requests even if those originates from a different domain. This is a problem as it would redirect the user to a different domain, and can even break AJAX requests in the Neos backend as they will be blocked by browser policies as being cross-domain requests.
