Sprint Focus:					
Subject:	FAL Extractor partially broken				
Description					
While developing "EXT:extractor", I have the feeling that the Extractor mechanism of FAL is partially broken. I don't know the exact way of reproducing (sometimes it works, sometimes not) but my feeling is that whenever you have a file uploaded and indexed, without any special metadata (= empty), that you upload it again (replacing) and this time tries to index it using the scheduler task, the extracted metadata are properly stored in database but associated to some other file meaning when "editing" the file back in fileadmin after that, it shows no metadata.

Hey Xavier,

is this still the case on master after our sprint?
