**Subject:** Equals (Query) ignore the propertyName in a comparison with objects.

### Description

Hello, I think the "propertyName" is ignored when comparing with objects (query, equals).

PostRepository:

```
works: $query->matching($query->equals('blog', $blog))
```

```
works too: $query->matching($query->equals('nothing', $blog))
```

I suspect that will return all objects that have a reference to the object of comparison. The propertyName is ignored.

I noticed the mistake because I have 2 properties in which the comparison object can be saved. I would now like to get back all the objects that reference the object at a particular property.
