[BUGFIX] Additional Identity Properties not set on mapping error

When binding Fluid forms to nested objects, Fluid automatically adds hidden fields with the identifiers of all affected objects so that the persistence layer can update all objects correctly.

When a form was redisplayed due to property mapping errors, the

identity fields for the nested sub objects were no longer created.

This change fixes this by making sure all identity fields are rendered recursively also after property mapping errors.

Backport from #29290

Resolves: #59253

Releases: master
