Sprint Focus:					
Subject:	Export referenced files into T3D file when exporting records with file references				
Description					
Exporting a page tree via T3D exports all records but sys_file. During import the importer tries to create the file reference and runs into an exception because the file is not found. So, there are two possibilities: <div><div>1. Prevent to export file references (imho nonsense)</div><div>2. Export file references and the related file</div></div>					
Related issues:

Importing references with missing files is handled in #58693.

If you export a pagetree not beginning on root, and you choose also related sys_files to be exported, all sys_files records and files are included in the exported that have relations to sys_file_reference records included in the export.

Is still an extra bug then? Or a dupe of #58693?
