Sprint Focus:			
Subject:	Index.php symlink causes error 500 (composer install on phpfpm)		

Description

Hello Guys,

during the installation of TYPO3 on several hosting providers using PHPFPM I discovered a weird problem.

We have a FS structure like this:

    typo3_src -> symlinked to a source
    index.php -> symlinked to typo3_src/index.php
    typo3 -> symlinked to typo3_src/typo3

Due to the fact, that they use FPM with some security mechanism you instantly get an error 500 if you access the frontend.

The problem is, that a called script itself is not allowed to be a symlink.

An easy solution would be to use a one liner which just includes / requires the before symlinked file for the composer install.

The problem occours on
 - DF.eu (shared hosting)
 - ...

Regards
Kay

We should do this anyway to avoid problems with updates.
