<b>Sprint Focus:</b>			
<b>Subject:</b>	Add TemplateRootPaths support to cObject FLUIDTEMPLATE		
<b>Description</b>			
<p>Now FLUIDTEMPLATE supports layoutRootPaths and partialRootPaths it would be a great addition if it also would support <u>templateRootPaths</u> with the same "<u>Template Path Fallback logic</u>" (#61361). Just like the ExtBase action controller does.</p> <p>The <u>template</u> value/parameter is already in use so maybe we should go for <u>templateName</u>.</p> <p>This brings the possibility to create a default Fluid based rendering setup that can easily be adjusted to use own templates by only adding your own layoutRootPaths, partialRootPaths and templateRootPaths where you only add the template you wish to override. And since the template fallback logic is there you can easily introduce new templates etc without the need to copy them to your own template set.</p> <p>For example:</p> <pre>lib.stdContent = FLUIDTEMPLATE lib.stdContent {     templateName = Default     layoutRootPaths {         10 = EXT:frontend/Resources/Private/Layouts         20 = EXT:sitemodification/Resources/Private/Layouts     }     partialRootPaths {         10 = EXT:frontend/Resources/Private/Partials         20 = EXT:sitemodification/Resources/Private/Partials     }     templateRootPaths {         10 = EXT:frontend/Resources/Private/Templates         20 = EXT:sitemodification/Resources/Private/Templates     }     variable {         foo = bar     } }</pre>

[FEATURE] Add TemplateRootPaths support to cObject FLUIDTEMPLATE

cObject FLUIDTEMPLATE is extended with `templateRootPaths` and `templateName`. Now you can set a template name and when rendering the template this name is used together with the set format to find the template in the given templateRootPaths with the same fallback logic as layoutRootPath and partialRootPath.

Resolves: #66111
