Subject:	As Phoenix team member I want a state-of-the art build and CI environment

Description

Suggestion for Build environments:

- integration_dev with own domain for fe access
- * building from the "phoenix" trunk (using (svn externals) to FLOW3, TYPO3 5.0 and the Demopackage that we want to build up)

- integration with own domain for FE access
- * building from the latest/defined tag (using also tagged packages and not trunk of packages)

Build Setups in Hudson:

1) phoenix-integration_dev_commit
   - Quick build that is triggered by SVN commits.
   - build xml just checkout the packages and run the basic unit tests
2) phoenix-integration_dev_full
   - triggered nightly
   - build that builds from scratch (empty folder):
   - build xml: * svn checkout of phoenix trunk * fill the contentrepository with a CR dump * system specific configurations (property file) * run unit tests * run integration unit tests and selenium tests
3) phoenix-integration_dev_tests and 4) phoenix-integration_tests
   - triggered manual only running the selenium tests
4) phoenix-integration_full
   - triggered manual (at en of sprint for instance)
   - simelar to phoenix-interagtion_dev_full but   * as the first step it tags the relevant packages * it tags the phoenix and adjust svn externals to new tag * then it builds from tag
Criteria:
   - phoenix-dev.typo3.org points to integration-dev
   - phoenix.typo3.org points to integration
   - Hudson shows the build projects
   - build (phing) files are in svn and understandable
   - some short system overview (physically) and some short explainations
