PHP Version:			
Has patch:	No		
Complexity:			
Subject:	Write settings using the ConfigurationManager		

Description

It should be possible to write settings using the ConfigurationManager, similar to PackageStates.yaml.
Rules:

 - constants that have been replaced upon reading should be reversed when writing
 - never write changes from a context to global settings
 - always write global settings

The last rule assumes that settings changes done through some interface are supposed to affect global settings, context specific changes are done manually.

Question: is this a valid assumption?
