Subject:	Tx_Fluid_ViewHelpers_Fo	Tx_Fluid_ViewHelpers_Form_RteViewHelper			
Description					
With the attached rtehtmlarea.	RteViewHelper.php (Tx_Fluid_View	ewHelpers_Form_RteViewHelper) it is possible to render a form field with the			
FormViewHelper. With this modifica filled in by the Rte	php in <u>https://svn.typo3.org/TYPO</u> tions the FormViewHelper gets the ViewHelper and adds this to the r	Viewhelper.php (see attached patch_FormViewHelper.diff based on <u>3v4/CoreProjects/MVC/fluid/trunk/</u> Revision 2522). e needed JS for all Rte form fields from the viewHelperVariableContainer which is eturned content. So I hope my suggestion matches your coding guidelines. If not, please tell me,

- File ScriptViewHelper.php added

Hi Bastian,

according to the feedback you gave me in the newslist (<u>http://lists.typo3.org/pipermail/typo3-project-typo3v4mvc/2010-August/006220.html</u> et al.) I modified the coding.

The result is, that I created a new Script VH which has to wrap the Form VH to prepend/append the required JavaScripts to the form. With the Script VH it is not anymore necessary to modify Form VH. And, of course, this VH could be used by other VH too.

Additionally I wrote a intermediate class Tx\_Fluid\_Classes\_Core\_ViewHelper\_RteConfiguration.

At the moment this class will probably not work with rte in backend modules because the class tx\_rtehtmlarea\_pi2 is, if I'm not wrong, especially for the frontend. But if you agree to the general concept of my class, it might be possible to extend the functionality. The onsubmit JavaScript I put as an event handler to the JavaScript beyond the form.

regards,

Frank

Hi,

It seems that there has been a change in current Fluid trunk which leads to an error with this wonderful view Helper. The key of the formname in the viewHelperVariableContainer has to be 'formObjectName' instead of 'formName' (see RteViewHelper.php on line 95).

Regards,

Jonas
